An UPS system is an alternate or backup source of power with the electric utility company being the primary source. The UPS provides protection of load against line frequency variations, elimination of power line noise and voltage transients, voltage regulation, and uninterruptible power for critical loads during failures of normal utility source.

Class II power supplies. A Class II component, or open frame power supply, needs no earth connection for safe operation. The minimum distance from any live part to the enclosure must be observed whether it is conductive or not in order to maintain the two levels of protection needed against a single failure in the system.

Supply installation refers to any electrical installation receiving electricity supply from its own generators.

Engineering-grade outdoor power supply installation

Electrical and supply installations are licensed to ensure that they are operated and maintained by licensed electrical workers, and are safe to use.

In traditional outdoor power applications, existing indoor power systems use long and oversized electrical wires that supply the remote outdoor power equipment. An outdoor UPS reduces the need for increasingly expensive copper wire.
