How does a pump inverter work?

Programming the inverter involves entering key parameters, e.g. the pressure or switching time. The inverter or controller automatically selects the optimum pump motor speed (reduces or increases speed). A constant pressure in the system increases comfort and reduces costs resulting from the operation of the pump.

Are inverters and controllers compatible with submersible and Ground pumps?

Inverters and controllers are compatible with submersible and ground pumps. The choice between controller and inverter depends on the user's personal preference and the place of application. The devices are used in: industry, domestic homes, garden and field irrigation installations, etc.

Why should you choose a pump controller & inverter?

Pump controllers and inverters ensure that costs are reduced and the life of the pump is longer. There are also advanced multifunctional control boxes that enable the selection of suitable operating parameters for pump systems. The units have many options for selection and personalisation according to user and workplace requirements.

Determine the type of pump: Single-phase or three-phase Select an inverter with a power that is greater than or equal to the pump power: This ensures that the inverter has enough power to supply the pump with the electricity it needs. Ensure that the inverter's input voltage range is compatible with the pump voltage: The input voltage range must be less than or equal ...
